Announcement of switch to renewable electricity

We are committed to continuously improving our environmental management under the ISO 14001 management system and are working to "reduce the environmental impact of our business activities".

We have converted all electricity used at our head office and factory to electricity generated from practically renewable energy sources (hereinafter referred to as "renewable electricity") under the "Re-energy ECO Plan" of Kansai Electric Power Company, Inc. from 1st May 2024.

Renewable electricity will be provided with a tracked non-fossil certificate with attribute information added to it. The switch to renewable electricity is expected to reduce CO2 emissions by approximately 180 tons of CO2 (in FY2023).

By manufacturing and selling conductive paste for high-efficiency solar cells, we have promoted the expansion of solar cells and the reduction of CO2 emissions worldwide. We will continue to contribute to global CO2 reduction and environmental protection through the development of new products.

We fully use CO2 free electricity derived from renewable energy

By taking advantage of the 'Re-energy ECO Plan' of Kansai Electric Power Co, we use CO2-free electricity derived from renewable energy sources.
